This report makes reference to the following document:

D1: DE 199 15 253 A (BOSCH GMBH ROBERT)

5 October 2000 (2000-10-05)

D1, which is considered to represent the prior art closest to the subject matter of claim 1, discloses (the references in parentheses are to this document):

A braking system for vehicles (see column 3, lines 5-9, and figure 2) with at least one first braking circuit (microcomputer 1 inside unit 10, together with the wheel brakes controlled by this microcomputer, see column 3, lines 9-16, see also column 4, lines 7-14) and at least one second braking circuit (microcomputer 2 inside unit 10, together with the wheel brakes controlled by this microcomputer), wherein each of the two braking circuits has an electrical open loop, each of which has a control electronics system (10), a dedicated power supply device (E1 or E2, see column 3, line 11 and column 3, line 64 to column 4, line 6) and brake actuating devices (50, 52, 54, 56) controllable by the control electronics systems, wherein at least one brake actuating device is

controllable by more than one control electronics system
(in this case, for example, by control electronics systems 58 or 10).

The subject matter of claim 1 differs from the closest prior art (D1) in that the braking circuits are electrically controllable by a service braking system valve, wherein the service braking system valve has two electrical brake sensor devices, each of which is connected to the control electronics systems in a mutually galvanically isolated manner.

The subject matter of claim 6 is therefore novel (PCT Article 33(2)).

The problem addressed by the present invention may therefore be considered that of providing an improved generic braking circuit which is electrically controllable by a service braking system valve.

The solution to this problem proposed in claim 1 of the present application involves an inventive step (PCT Article 33(3)). The reasons are:

None of the prior art documents discloses a solution wherein the service braking system valve has two electrical brake sensor devices, each of which is connected to the control electronics systems in a mutually galvanically isolated manner.

Claims 2-5 are dependent on claim 1 and therefore likewise meet the PCT requirements for novelty and
